

BOARD CLAMPS

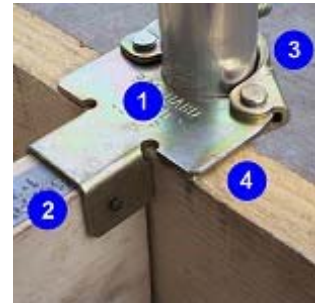

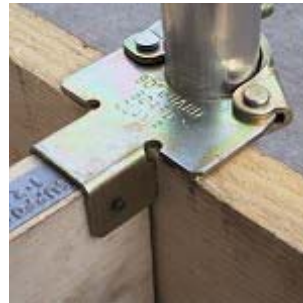

Board Retaining Clamp

Boards are quickly and securely locked in the correct position. With considerable resistance to both lateral and upward movement their use is recommended in windy conditions.

Toe Board Clamp

Ideal for fast and economical retention of toe boards. The hook simply locates onto the standard and, when tightened, the plate grips the tube and exerts pressure onto the board, resisting lateral and upwards movement.

90° Board Clamp

This 90° board clamp has been designed for the specific purpose of correctly securing guard boards safely, quickly and economically.

With the Presco 90° board clamp, scaffold stop-ends and scaffold guard board returns are neatly and efficiently locked into the correct positions making a more secure scaffolding. These one-piece fittings have the standard easy-fix Presco cover.

- 1** Top Plate of 5mm mild steel locates on the top edge of the board, maintaining a secure position against the tube and a firm location to the adjacent return.
- 2** The returning board fits snugly into this channel. It is held securely at 90° to the adjacent board and is retained in the correct position.
- 3** The Presco cover ensures fast and easy fixing with simultaneous security of both boards.
- 4** The board is trapped between the standard and the returning board making a secure platform.
